

IN THE CLAIMS

Please amend the claims as follows:

1. (Cancelled)
2. (Previously Presented) The semiconductor laser device according to claim 7, wherein said current blocking layer consisting of a semiconductor is formed not on the upper surface of said ridge portion but on the upper surfaces of said support portions.
3. (Original) The semiconductor laser device according to claim 2, wherein said support portions are substantially flush with the upper surface of said ridge portion.
4. (Previously Presented) The semiconductor laser device according to claim 7, wherein said first metal electrode includes a plurality of metal electrode layers.
5. (Previously Presented) The semiconductor laser device according to claim 7, wherein said first metal electrode includes an upper surface having an irregular shape reflecting the shape of said convex ridge portion, the shape of said support portions and the shape of said current blocking layer.
6. (Original) The semiconductor laser device according to claim 5, wherein the height of portions of said first metal electrode located on said support portions exceeds that of a portion located on said ridge portion.

7. (Currently Amended) A semiconductor laser device, comprising:

- an emission layer formed on a substrate;
- a semiconductor layer formed on said emission layer while constituting a convex ridge portion;
- a current blocking layer comprising a semiconductor formed to cover at least the side surfaces of said ridge portion;
- a first metal electrode formed on the upper surface of said ridge portion; and
- convex support portions arranged on both sides of said ridge portion at a prescribed interval from said ridge portion,

wherein said convex ridge portion and said support portions are mounted on a submount through a welding layer,

the first metal electrode is formed to cover the ridge portion and the support portions, and

the current blocking layer is formed on the upper surfaces of the support portions and the

first metal electrode is formed on said current blocking layer.

8. (Original) The semiconductor device according to claim 7, wherein said first metal electrode is so mounted on said submount that portions of said first metal electrode located on said support portions are in contact with said submount and a portion of said first metal electrode located on said ridge portion is not in contact with said submount.

9. (Previously Presented) The semiconductor device according to claim 7, wherein side surfaces of said support portions closer to end surfaces of said semiconductor laser device

are arranged inward beyond said end surfaces of said semiconductor laser device at a prescribed interval.

10. (Previously Presented) The semiconductor laser device according to claim 7, wherein said current blocking layer covers side surfaces of said support portions closer to end surfaces of said semiconductor laser device, the upper surfaces of said support portions and side surfaces of said support portions closer to said ridge portion.

11. (Previously Presented) The semiconductor laser device according to claim 7, wherein the thickness of said first metal electrode is at least 5 μm .

12. (Previously Presented) The semiconductor device according to claim 7, wherein said first metal electrode contains a dopant having the same conductivity type as said semiconductor layer constituting said ridge portion.

13. (Original) The semiconductor laser device according to claim 12, wherein said semiconductor layer constituting said ridge portion consists of a group III-V compound semiconductor, and

said dopant, contained in said first metal electrode, having the same conductivity type as said semiconductor layer constituting said ridge portion includes at least one element selected from a group consisting of Zn, Cd, Be, Mg, Ca and Ba.

14. (Previously Presented) The semiconductor laser device according to claim 7, wherein a plurality of said convex support portions are arranged on each side of said ridge portion.

15. (Currently Amended) A semiconductor laser device, comprising:
an emission layer formed on a substrate;
a semiconductor layer formed on said emission layer while constituting a convex ridge portion;
a current blocking layer comprising a semiconductor formed to cover at least the side surfaces of said ridge portion;
a first metal electrode formed on the upper surface of said ridge portion; and
convex support portions arranged on both sides of said ridge portion at a prescribed interval from said ridge portion,
wherein said emission layer includes a plurality of emission layers, formed on said substrate at a prescribed interval, each having an emission portion, and
said semiconductor layer constituting said convex ridge portion, said current blocking layer, said first metal electrode and said convex support portions are formed on each of said plurality of emission layers,
the first metal electrode is formed to cover the ridge portion and the support portions, and
the current blocking layer is formed on the upper surfaces of the support portions and the
first metal electrode is formed on said current blocking layer.

16. (Currently Amended) A semiconductor laser device, comprising:

an emission layer formed on a substrate;

a semiconductor layer formed on said emission layer while constituting a convex ridge portion;

a current blocking layer comprising a semiconductor formed to cover at least the side surfaces of said ridge portion;

a first metal electrode formed on the upper surface of said ridge portion; and

convex support portions arranged on both sides of said ridge portion at a prescribed interval from said ridge portion,

wherein the interval between the lower end of said ridge portion and the lower ends of said support portions is at least 20 μm ,

the first metal electrode is formed to cover the ridge portion and the support portions, and

the current blocking layer is formed on the upper surfaces of the support portions and the

first metal electrode is formed on said current blocking layer.

17. (Original) The semiconductor laser device according to claim 16, wherein the interval between the lower end of said ridge portion and the lower ends of said support portions is not more than 100 μm .

18. (Original) The semiconductor laser device according to claim 16, wherein said current blocking layer consists of a compound semiconductor containing aluminum.

19. (Withdrawn) A semiconductor laser device comprising:

an emission layer formed on a substrate;

a semiconductor layer formed on said emission layer while constituting a convex ridge portion;

a current blocking layer formed on a side of said ridge portion;

a first metal electrode formed to be in contact with the upper surface of said ridge portion; and

a second metal electrode, formed on said first metal electrode, superior in adhesiveness to said first metal electrode.

20. (Withdrawn) The semiconductor laser device according to claim 19, wherein said second metal electrode is formed to be in contact with said current blocking layer.

21. (Withdrawn) The semiconductor laser device according to claim 19, wherein said first metal electrode contains a dopant having the same conductivity type as said semiconductor layer constituting said ridge portion.

22. (Withdrawn) The semiconductor laser device according to claim 21, wherein said semiconductor layer constituting said ridge portion consists of a group III-V compound semiconductor, and

said dopant, contained in said first metal electrode, having the same conductivity type as said semiconductor layer constituting said ridge portion includes at least one element selected from a group consisting of Zn, Cd, Be, Mg, Ca and Ba.

23. (Withdrawn) The semiconductor laser device according to claim 19, wherein

the sum of the thicknesses of said first metal electrode and said second metal electrode is at least 5 μm .

24. (Currently Amended) A method of fabricating a semiconductor laser device, comprising steps of:

forming an emission layer on a substrate;
forming a semiconductor layer constituting a convex ridge portion on said emission layer;
~~forming a current blocking layer consisting of a semiconductor to cover at least the side surfaces of said ridge portion~~

forming a convex support portion so that ~~the~~ an interval between the lower end of said ridge portion and the lower end of said support portion is at least 20 μm ;

forming a current blocking layer consisting of a semiconductor to cover the side surfaces of said ridge portion, and the side surfaces and the upper surfaces of said support portions; and

forming a first metal electrode to cover the upper surfaces of said ridge portion and the side surfaces and upper surfaces of said support portions.

25. (Original) The method of fabricating a semiconductor laser device according to claim 24, wherein said step of forming said support portion includes a step of forming said support portion so that the interval between the lower end of said ridge portion and the lower end of said support portion is not more than 100 μm .

26. (Original) The method of fabricating a semiconductor laser device according to claim 24, wherein said step of forming said current blocking layer includes steps of:

forming a mask consisting of a dielectric substance on the upper surface of said ridge portion, and

crystal-growing said current blocking layer consisting of a semiconductor on a portion other than said mask.

27. (Previously Presented) The semiconductor laser device according to claim 7, further comprising a second metal electrode, formed on said first metal electrode, superior in adhesiveness to said first metal electrode.
